# Problem Frame

High school mathematics students suffer from **high levels of math anxiety (71.5%)** and **cognitive freeze** during **practice**. The **primary breakdown** occurs not in **understanding basic theory**, but in **procedural execution** *(57.1% struggle to translate formulas into action on paper)*. Furthermore, standard **timed drills and unassisted homework** cause students to avoid practice altogether due to **panic (85.7%), lack of motivation** and a **lack of immediate guidance** when stuck.

# How Might We (HMW)

How might we design a pressure-free, engaging **fantasy RPG** that transforms procedural math practice into intrinsic **gameplay**, providing **real-time** Socratic guidance so learners can overcome **execution** friction and **build** math confidence without anxiety?
